| 1 | Getting Started | 3 |
| 2 | WebIDValidator | 5 |
| 3 | WebID Client | 7 |
| 4 | Using python-webid from other apps | 9 |
| 5 | TestSuite | 11 |
| 6 | Indices and tables | 13 |

python-webid is an *early-alpha* implementation of the [WebID](#) Identification and Discovery protocol.

Currently it consists only of a validator and a (very simple, really) client.

Getting Started

```
git clone git://github.com/bennomadic/python-webid.git
```

TBD (setup install, pypi...)

WebIDValidator

The validator, besides checking if a given client WebID certificate matches the conditions for allowing a WebID authentication, returns a set of result objects that can be used to generate a spec-compliance report.

For now, the validator parses the earl vocabulary for the WebID authentication and uses some of the extracted information to structure the series of checks that lead to the WebID validation.

Read more about the [WebID Test Suite](#)

To use the validator, you have to initialize it passing a base64 encoded certificate:

```
from webid.validator import WebIDValidator

certstr = """
-----BEGIN CERTIFICATE-----
MIIDGjCCAoOgAwIBAgIBaDANBgkqhkiG9w0BAQUFADBjMSYwJAYDVQQDEX1Ob3Qg
YSBDZXJ0aWZpY2F0aW9uIEF1dGhvcm10eTERMA8GA1UEChMIRk9BRitTU0wxJjAk
...
kgBsn3XOUUqKQXMe+uH2Q5fCYKRqYCBCC1qpLy3x
-----END CERTIFICATE-----
"""

webidval = WebIDValidator(certstr=certstr)
validated, data = validator.validate()
```

where *validated* is a bool indicating whether the authentication was successful or not.

Not very polished yet... but you can inspect the results for the passed checks (by execution order) in:

```
webidval.testbed.tests
```

WebID Client

TBD

Using python-webid from other apps

TBD: django app for webid auth

TestSuite

TBD

Contents:

Indices and tables

- genindex
- modindex
